

INTRODUCTION

Currently, 1.9 million people are living with limb loss in the United States, with an average of 507 people continuing to lose a limb every day. This results in an estimated 185,000 amputations per year (1), and this number is expected to double by the year 2050 due to increasing rates of diabetes and vascular disease (1). Among those living with limb loss, the major causes of their amputations are vascular disease (54%) – including diabetes and peripheral arterial disease – trauma (45%) and cancer (less than 2%) (2). The most common causes of pediatric amputations, however, are lawn mower accidents (3). Non-whites comprise about 42% of the limb loss population in the U.S. (1). In 2008, the diabetes related amputation rate among African Americans was nearly four times that of whites (4).

A total of 1,752 amputations were performed in Arkansas hospitals in 2014. These amputations were performed for a variety of reasons, including diabetes and peripheral arterial disease complications. The following information details the trends and most current rates of amputation and diabetes in Arkansas.

1. AMPUTATION TRENDS OVER TIME

1.1: Amputations Trends, Arkansas (2004-2014)

According to hospital discharge data, the number of total amputations performed in Arkansas was at a low in 2005 (1,453) and a high in 2013 (1,769). This overall time period represents a 15.95% increase. A total of 17,265 amputations were performed in this time period. (See Graph 1.1)

1.2: Upper-Extremity Amputation Trends, Arkansas (2004-2014)

In Arkansas, the total number of upper-extremity amputations performed from 2004 to 2014 was 1,142. The year 2004 saw the most of these types of amputations (136), while the lowest incidence (84) occurred in 2008. There is a 31.62% decrease in this time period. (See Graph 1.2)

Source: Healthcare Cost and Utilization Project HCUPnet database <http://hcupnet.ahrq.gov/>

1.3: Lower-Extremity Amputation Trends, Arkansas (2004-2014)

A total of 16,123 of lower-extremity amputations were performed from 2004 to 2014. The incidences of these amputations spiked to 1,676 in 2013 and were at their lowest at 1,349 in 2005. This represents a 20.65% increase in the number of lower-extremity amputations from 2004 to 2014. (See Graph 1.3)

2. TYPES OF AMPUTATIONS PERFORMED

71 upper-extremity amputations were reported in 2014. The most common minor upper-extremity amputation was of the fingers (71) and no other types of procedures were reported (See Graph 2.1)

2.1: Upper-Extremity Amputations, Arkansas (2014)

Source: Healthcare Cost and Utilization Project HCUPnet database
<http://hcupnet.ahrq.gov/>

2.2: Lower-Extremity Amputations, Arkansas (2014)

1,600 lower-extremity amputations were performed in 2014. In terms of minor lower-extremity amputations, toes (648) were amputated more often than part of the foot (165). For major lower-extremity amputations, below-knee (509) amputation was the most common procedure, followed by above-knee (278) procedures. (See Graph 2.2)

3. WHO LOSES A LIMB?

In 2014, most amputations were performed on individuals aged 45-64 years old, closely followed by the age group of 65-84 year olds (See Graph 3.1).

3.1: Amputations by Age Groups, Arkansas (2014)

Source: Healthcare Cost and Utilization Project HCUPnet database
<http://hcupnet.ahrq.gov/>

3.2: Amputations by Sex, Arkansas (2014)

There were slightly more than 2 times more amputations performed on male patients in Arkansas than on female patients (See Graph 3.2).

<http://hcupnet.ahrq.gov/>

Medicare recipients ranked as the most common group to have an amputation procedure (See Graph 3.3).

3.3: Amputations by Payer Type, Arkansas (2014)

<http://hcupnet.ahrq.gov/>

3.4: Amputations by Race/Ethnicity, Arkansas (2014)

Source: Healthcare Cost and Utilization Project HCUPnet database
<http://hcupnet.ahrq.gov/>

We can see that the African American population of Arkansas bears the heaviest burden of amputation (0.073% of the African American population underwent amputations). This is evident when compared with the percentage of the white population that underwent amputations (0.054%), and with amputations in the state's population as a whole (0.059%). (See Graph 3.4)

* According to Census Bureau estimation data (http://factfinder.census.gov/faces/tableservices/jsf/pages/productview.xhtml?sr_c=CF), the population of Arkansas in 2014 was about 2,947,036 and was made up of about 2,306,073 white residents and 458,136 African American residents.

4. DIABETES TRENDS

4.1: Diabetes Cases (in thousands; 18+), Arkansas (1994-2014)

In 2014, a total of 288,781 Arkansas residents indicated that they had been diagnosed with diabetes at some point in their lives. The prevalence of diabetes in the adult population of Arkansas increased 204.2% from 1994 to 2014. (See Graph 4.1)

Source: CDC Behavioral Risk Factor Surveillance System <https://gis.cdc.gov/grasp/diabetes/DiabetesAtlas.html>

4.2: Existing Diabetes per 100 Adults (18+), Arkansas (1994-2014)

The annual rate of existing cases of diabetes among adults in Arkansas decreased 117% from 1994 to 2014. (See Graph 4.2)

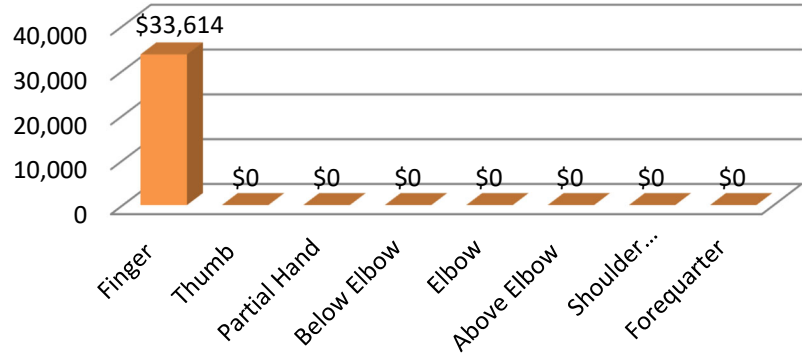

Source: CDC Behavioral Risk Factor Surveillance System <https://gis.cdc.gov/grasp/diabetes/DiabetesAtlas.html>

5. HEALTHCARE COSTS

For persons with a unilateral lower-extremity amputation, the two year healthcare costs, including initial hospitalization, inpatient rehabilitation, outpatient physical therapy, and purchase and maintenance of a prosthetic device, is estimated to be \$91,106. The lifetime healthcare cost for persons with a unilateral lower extremity amputation is estimated to be more than \$500,000 (5). It is anticipated that these healthcare costs would be higher for a person with a proximal amputation level and bilateral amputation status, due to higher prosthetic costs.

Charges represent what the hospital billed for the case, and may not represent all discharges for amputations. (See graph 5.1)
